On the basis of the experience gathered from about
30,000 light anesthetics in Germany, (isopropyl
chloride) is a useful substitute for ethyl chloride, and
can be considered capable of replacing "Trilene" as an
analgesic. As with ethyl chloride, the excitation stage
must not be exceeded, and should be avoided altogether.

A study was made of the thermal decomposition of ammonium nitrate in the course of evaporation of its solutions at a pressure of 550 mm Hg over a temperature range of 165 to 240° and for various lengths of evaporation time. It was found that the losses (calculated with respect to nitrogen) in the range of 180° to 200° and for an evaporation time of 2 min were between (Chemistry--Physical, TT, v. 11, no. 11) (over)

Ammonia and ammonium nitrate in solution reacted with nitrogen oxides, forming elemental nitrogen. It was established, that by occurrence of ammonium nitrate in the solution, losses of tied nitrogen should occur in the process of nitrogen oxides absorption because of NH_4NO_3 decomposition through the stage of ammonium nitrite and nitrous acid formation. Therefore application of solutions containing additives of ammonium nitrate, in the manufacture of nitric acid, without their prior removal, is irrational (sic.). The use of waste condensate from secondary steam, with a (Chemistry--Inorganic, TT, v. 5, no. 4) (over)
